

# Shader

## GLSL Syntax

# OpenGL Reference Card Page 6ff

Page 6		OpenGL Shading Language 4.30 Reference Card																																																																																																													
<p>The OpenGL® Shading Language is used to create shaders for each of the programmable processors contained in the OpenGL processing pipeline. The OpenGL Shading Language is actually several closely related languages. Currently, these processors are the vertex, tessellation control, tessellation evaluation, geometry, fragment, and compute shaders.</p> <p>[n.n.n] and [Table n.n] refer to sections and tables in the OpenGL Shading Language 4.30 specification at <a href="http://www.khronos.org/registry">www.khronos.org/registry</a>.</p>		<h3>Preprocessor [3.3]</h3> <h4>Preprocessor Directives</h4> <table> <tr> <td>#</td><td>#define</td><td>#if</td><td>#if</td><td>#else</td></tr> <tr> <td>#extension</td><td>#version</td><td>#ifdef</td><td>#ifndef</td><td>#undef</td></tr> <tr> <td>#error</td><td>#include</td><td>#line</td><td>#pragma</td><td></td></tr> </table> <h4>Preprocessor Operators</h4> <table> <tr> <td>#version 430</td><td>Required when using version 4.30.</td></tr> <tr> <td>#extension name : behavior</td><td>extension_name: behavior</td></tr> <tr> <td>#extension name : all</td><td>extension_name: all</td></tr> </table> <h3>Predefined Macros</h3> <table> <tr> <td>__LINE__</td><td>Decimal integer constants. __FILE__ says which source string is being processed.</td></tr> <tr> <td>__VERSION__</td><td>Decimal integer, e.g.: 430</td></tr> <tr> <td>GL_core_profile</td><td>Defined as 1.</td></tr> <tr> <td>GL_es_profile</td><td>1 if the implementation supports the es profile.</td></tr> <tr> <td>GL_compatibility_profile</td><td>Defined as 1 if the implementation supports the compatibility profile.</td></tr> </table>		#	#define	#if	#if	#else	#extension	#version	#ifdef	#ifndef	#undef	#error	#include	#line	#pragma		#version 430	Required when using version 4.30.	#extension name : behavior	extension_name: behavior	#extension name : all	extension_name: all	__LINE__	Decimal integer constants. __FILE__ says which source string is being processed.	__VERSION__	Decimal integer, e.g.: 430	GL_core_profile	Defined as 1.	GL_es_profile	1 if the implementation supports the es profile.	GL_compatibility_profile	Defined as 1 if the implementation supports the compatibility profile.																																																																													
#	#define	#if	#if	#else																																																																																																											
#extension	#version	#ifdef	#ifndef	#undef																																																																																																											
#error	#include	#line	#pragma																																																																																																												
#version 430	Required when using version 4.30.																																																																																																														
#extension name : behavior	extension_name: behavior																																																																																																														
#extension name : all	extension_name: all																																																																																																														
__LINE__	Decimal integer constants. __FILE__ says which source string is being processed.																																																																																																														
__VERSION__	Decimal integer, e.g.: 430																																																																																																														
GL_core_profile	Defined as 1.																																																																																																														
GL_es_profile	1 if the implementation supports the es profile.																																																																																																														
GL_compatibility_profile	Defined as 1 if the implementation supports the compatibility profile.																																																																																																														
<h3>Operators and Expressions [5.1]</h3> <p>The following operators are numbered in order of precedence. Relational and equality operators evaluate to Boolean. # GLSL Syntax Overview

- GLSL is like C without
  - Pointers
  - Recursion
  - Dynamic memory allocation
- GLSL is like C with
  - Built-in vector, matrix and sampler types
  - Constructors
  - A math library
  - Input and output qualifiers

# GLSL Syntax Overview

- GLSL has a preprocessor

```
#version 330
#ifdef FAST_EXACT_METHOD
    FastExact();
#else
    SlowApproximate();
#endif
```

- All shaders have main()

```
void main() {
    ...
}
```

# Vectors

- Scalar types: **float**, **int**, **uint**, and **bool**
- Vectors are also built-in types:
  - **vec2**, **vec3**, and **vec4**
  - Also **ivec\***, **uvec\***, and **bvec\***
- Access components three ways:
  - `.x, .y, .z, .w` ← position or direction
  - `.r, .g, .b, .a` ← color
  - `.s, .t, .p, .q` ← texture coordinate

# Vectors

- Vectors have constructors

```
vec3 xyz = vec3(1.0, 2.0, 3.0);
```

```
vec3 xyz = vec3(1.0); // [1.0, 1.0, 1.0]
```

```
vec3 xyz = (vec3)1.0; // error
```

```
vec3 xyz = vec3(vec2(1.0, 2.0), 3.0);
```

# Swizzling

- Swizzle: select or rearrange components

```
vec4 c = vec4(0.5, 1.0, 0.8, 1.0);

vec3 rgb = c.rgb;    // [0.5, 1.0, 0.8]
      rgb = c.xyz;    // same thing! [0.5, 1.0, 0.8]
vec3 bgr = c.bgr;    // [0.8, 1.0, 0.5]

vec3 rrr = c.rrr;    // [0.5, 0.5, 0.5]

c.a = 0.5;            // [0.5, 1.0, 0.8, 0.5]
c.rb = vec2(0.0);      // [0.0, 1.0, 0.0, 0.5]

float g = rgb[1];     // 0.5, indexing, not swizzling
```

# Matrices

- Matrices are built-in types:
  - Square: `mat2`, `mat3`, and `mat4`
  - Rectangular: `matmxn`. `m` columns, `n` rows
    - `mat2x3`
- Stored column major

# Matrices

- Matrix Constructors

```
mat3 i = mat3(1.0); // 3x3 identity matrix  
  
mat2 m = mat2(1.0, 2.0, // [1.0 3.0] column major!  
              3.0, 4.0); // [2.0 4.0]
```

- Accessing Elements

```
float f = m[column][row]; // m some 3x3 matrix  
  
float x = m[0].x; // x component of first column  
  
vec2 yz = m[1].yz; // yz components of second column
```

# Vectors and Matrices

- Matrix and vector operations are easy and fast:

```
vec3 xyz = // ...

vec3 v0 = 2.0 * xyz;           // scale
vec3 v1 = v0 + xyz;           // component-wise
vec3 v2 = v0 * xyz;           // component-wise

mat3 m = mat3(v0, v1, v2);    // give columns
mat3 m2 = mat3(2.0);          // diagonal all 2's

mat3 m3 = 3.0 * m;            // scale a matrix
mat3 mm2 = m * m2;            // matrix * matrix
vec3 xyz2 = mm2 * xyz;        // matrix * vector
```

# Built-in Functions

- Selected Trigonometry Functions

```
float s = sin(theta);  
float c = cos(theta);  
float t = tan(theta);  
  
float as = asin(theta);  
  
vec3 angles = vec3(/* ... */);  
vec3 vs = sin(angles); //vector version
```

# Built-in Functions

- Exponential Functions

```
float xToTheY = pow(x, y);  
float eToTheX = exp(x);  
float twoToTheX = exp2(x);  
  
float l = log(x); // ln  
float l2 = log2(x); // log2  
  
float s = sqrt(x);  
float is = inversesqrt(x); // single GPU instr.
```

# Built-in Functions

- Selected Common Functions

```
float ax = abs(x); // absolute value
float sx = sign(x); // -1.0, 0.0, 1.0

float m0 = min(x, y); // minimum value
float m1 = max(x, y); // maximum value
float c  = clamp(x, 0.0, 1.0);

// many others: floor(), ceil(),
// step(), smoothstep(), ...
```

# Built-in Functions

- Rewrite with one function call

```
float minimum = // ...  
float maximum = // ...  
float x = // ...  
  
float f = min(max(x, minimum), maximum);  
  
float f = clamp(x, minimum, maximum);
```

# Built-in Functions

- Rewrite this without the **if** statement

```
float x = // ...
float f;

if (x > 0.0) {
    f = 2.0;
}
else {
    f = -2.0;
}

f = 2.0 * sign(x);
```

# Built-in Functions

- Rewrite this without the **if** statement

```
float root1 = // ...
float root2 = // ...

if (root1 < root2) {
    return vec3(0.0, 0.0, root1);
}
else {
    return vec3(0.0, 0.0, root2);
}

return vec3(0.0, 0.0, min(root1, root2));
```

# Built-in Functions

- Selected Geometric Functions

```
vec3 l = // ...
vec3 n = // ...
vec3 p = // ...
vec3 q = // ...

float f = length(l); // vector length
float d = distance(p, q); // point dist.
float d2 = dot(l, n); // dot product
vec3 v2 = cross(l, n); // cross product
vec3 v3 = normalize(l); // normalize
vec3 v3 = reflect(l, n); // reflect

// also: faceforward() and refract()
```

# Built-in Functions

- **reflect** ( $-l, n$ )
  - Given  $l$  and  $n$ , find  $r$
  - Angle in = angle out

# Built-in Functions

- Rewrite without **length**

```
vec3 p = // ...  
vec3 q = // ...  
  
vec3 v = length(p - q);  
  
vec3 v = distance(p, q);
```

# Built-in Functions

- What is wrong with this code?

```
vec3 n = // ...  
normalize(n);
```

# Built-in Functions

- Selected Matrix Functions

```
mat4 m = // ...  
  
mat4 t = transpose(m) ;  
float d = determinant(m) ;  
mat4 d = inverse(m) ;
```

# Built-in Functions

- Selected Vector Relational Functions

```
vec3 p = vec3(1.0, 2.0, 3.0);  
vec3 q = vec3(3.0, 2.0, 1.0);  
  
bvec3 b = equal(p, q);           // (false, true, false)  
bvec3 b2 = lessThan(p, q);       // (true, false, false)  
bvec3 b3 = greaterThan(p, q);    // (false, false, true)  
  
bool b4 = any(b);                // true  
bool b5 = all(b);                // false
```

# Built-in Functions

- Rewrite this in one line of code

```
bool foo(vec3 p, vec3 q) {  
    if (p.x < q.x) {  
        return true;  
    }  
    else if (p.y < q.y) {  
        return true;  
    }  
    else if (p.z < q.z) {  
        return true;  
    }  
    return false;  
}  
return any(lessThan(p, q));
```

# Samplers

- *Opaque* types for accessing textures
- Always **uniform**

```
// fragment shader
uniform sampler2D colorMap; // 2D texture

vec3 color = texture(colorMap, vec2(0.5, 0.5)).rgb;

vec2 size = textureSize(colorMap, 0);

// Lots of sampler types: sampler1D,
// sampler3D, sampler2DRect, samplerCube,
// isampler*, usampler*, ...
// Lots of sampler functions: texelFetch, textureLod
```

# Samplers

- Returns **vec4**
- Coordinate access differs by sampler type

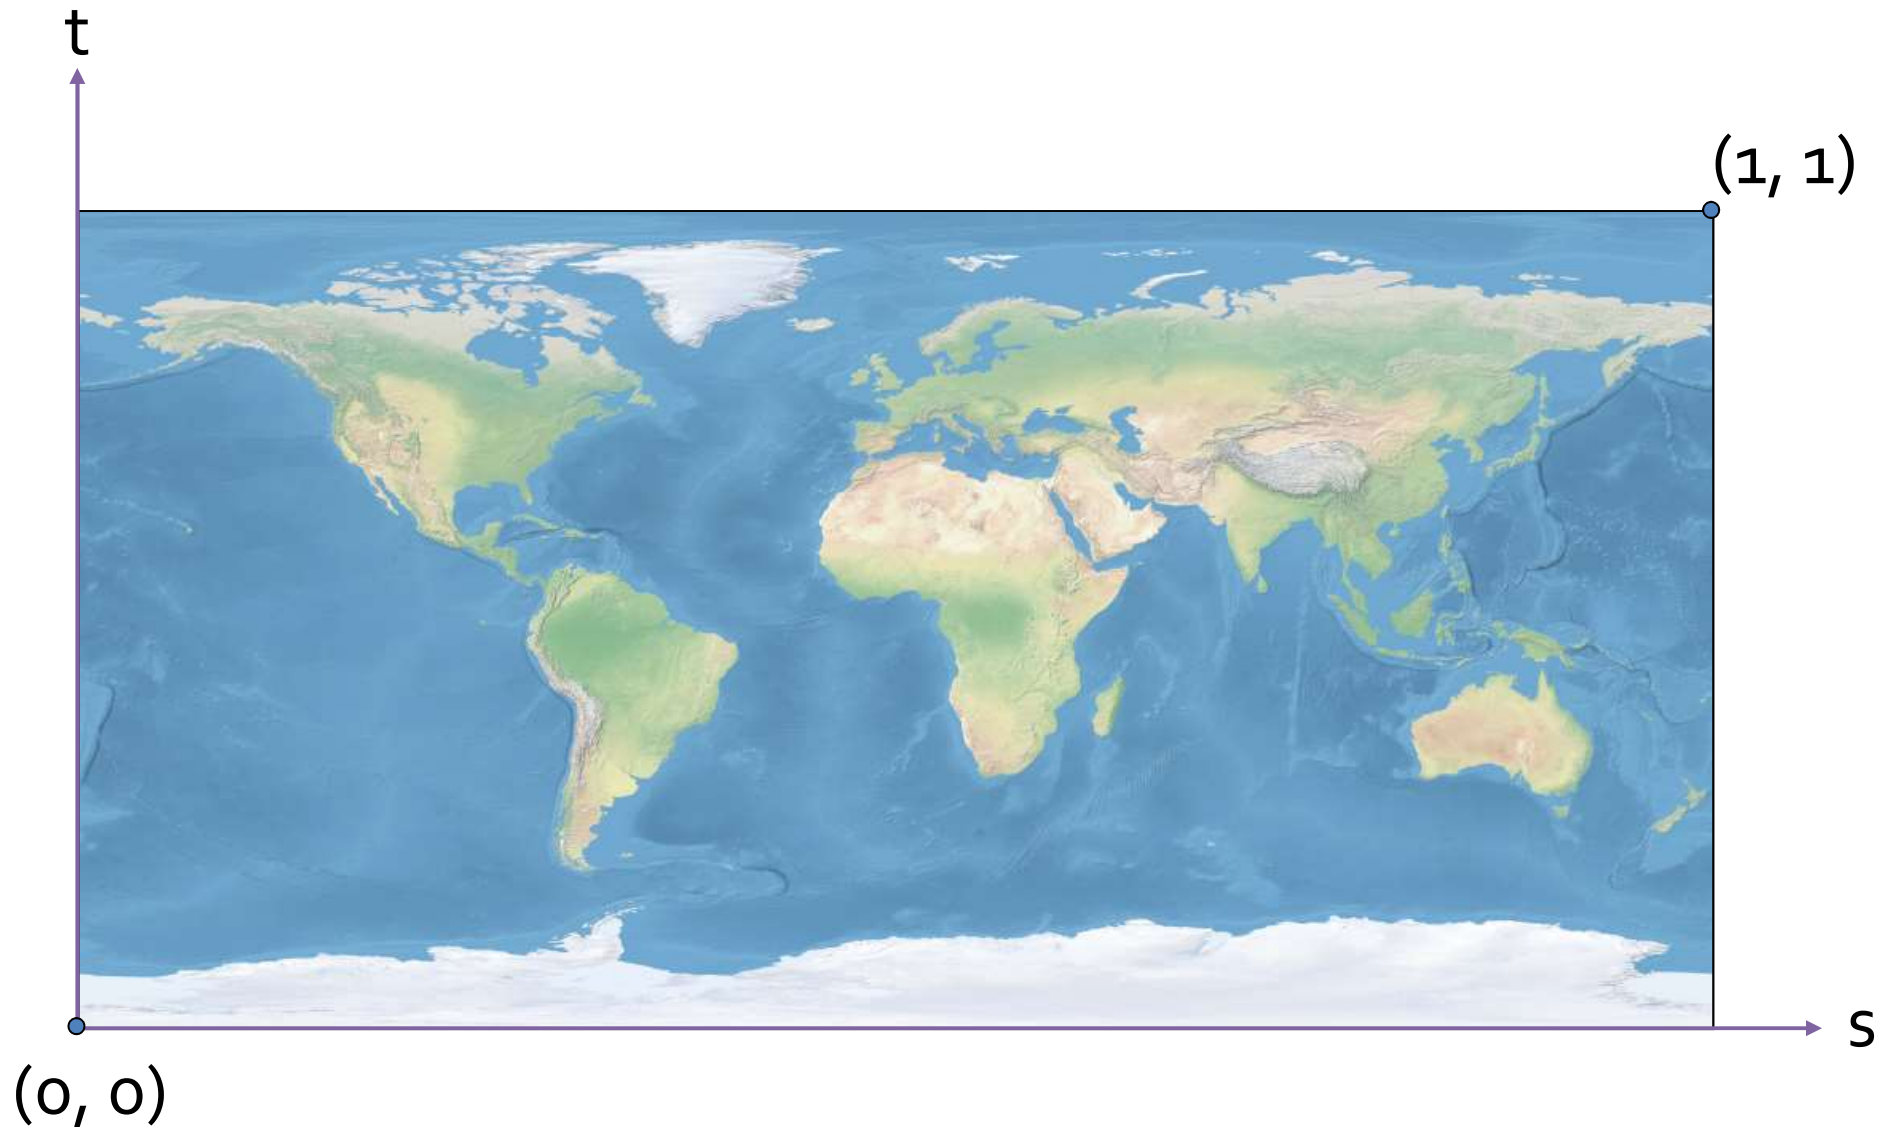

```
// fragment shader
uniform sampler2D colorMap; // 2D texture

vec3 color = texture(colorMap, vec2(0.5, 0.5)).rgb;

vec2 size = textureSize(colorMap, 0);

// Lots of sampler types: sampler1D,
// sampler3D, sampler2DRect, samplerCube,
// isampler*, usampler*, ...
// Lots of sampler functions: texelFetch, textureLod
```
